

# Introduction

# Namespace Itsm.Tdx.WebApi

## Classes

[BaseRequestBuilder](#)

[TdxBaseClient](#)

[TdxClient](#)

[TdxClientFactory](#)

Factory for creating [HttpClient](#) instances with advanced control over message handlers. Consumers can:

- Create any number of custom [DelegatingHandler](#) instances (e.g., logging, authentication, retry, telemetry).
- Pass them as a collection to the factory method. The factory chains these handlers together and builds an [HttpClient](#) instance that executes all handlers in the specified order.
